

Fourth Grade Science: First Nine Weeks

<p>VA Standards of Learning (SOL) Essential Understandings for Instruction</p>	<p>Content Knowledge and Skills</p>	<p>MCPS Adopted Materials</p>	<p>Supporting Materials</p>
<p>4.1 The student will plan and conduct investigations</p> <p>The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> The nature of science refers to the foundational concepts that govern the way scientists formulate explanations about the natural world. The nature of science includes the following concepts: <ol style="list-style-type: none"> the natural world is understandable; science is based on evidence, both observational and experimental; science is a blend of logic and innovation; scientific ideas are durable yet subject to change as new data are collected; science is a complex social endeavor; and scientists try to remain objective and engage in peer review to help avoid bias. <p>In grade four, an emphasis should be placed on concepts a, b, c, d, and e.</p> <ul style="list-style-type: none"> Science assumes that the natural world is understandable. Scientific inquiry can provide explanations about nature. This expands students' thinking from just a knowledge of facts to understanding how facts are relevant to everyday life. Science demands evidence. Scientists develop their ideas based on evidence and they change their ideas when new evidence becomes available or the old evidence is viewed in a different way. Science uses both logic and innovation. Innovation has always been an important part of science. Scientists draw upon their creativity to visualize how nature works, using analogies, metaphors, and mathematics. Scientific ideas are durable yet subject to change as new data are collected. The main body of scientific knowledge is very stable and grows by being corrected slowly and having its boundaries extended gradually. Scientists themselves accept the notion that scientific knowledge is always open to improvement and can never be declared absolutely certain. New questions arise, new theories are proposed, new instruments are invented, and new techniques are developed. 	<p>Standard 4.1 does not require a discrete unit on scientific investigation because the inquiry skills that make up the standard should be incorporated in all the other 4th grade science standards. Each skill has been connected to specific content within this curriculum guide, but teachers may also provide instruction in any of the skills throughout the school year.</p> <p>In order to meet this standard, it is expected that students will:</p> <ul style="list-style-type: none"> Differentiate among simple observations, conclusions, inferences, and predictions, and correctly apply the terminology in oral and written work. This requires students to comprehend the basic terminology and apply it in novel situations related to fourth grade SOL concepts. Analyze a set of 20 or fewer objects, measures, or pictures; classify them into basic categories to organize the data (descriptive or numerical); and construct bar graphs and line graphs depicting the distribution of those data. Use millimeters, centimeters, meters, kilometers, milliliters, liters, grams, and kilograms in measurement. Choose the appropriate instruments, including centimeter rulers, meter sticks, graduated cylinders, beakers, scales and balances, and Celsius thermometers, for making basic metric measures. measure elapsed time using a stopwatch or a clock. make predictions, inferences, and draw conclusions using a variety of sources such 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 1: Scientific Investigation</p>	<p>AIMS <u>SI Notebook</u> Candy Counting Are You a Square?</p> <p><u>Math and Science: A Solution</u> It's a Shoe Unique U</p> <p><u>Overhead and Underfoot</u> Sherlock Combs the Yard</p> <p><u>Hardhatting in a Geo-World</u> Student-Made Measuring tools</p>

<ul style="list-style-type: none"> • Science is a complex social endeavor. It is a complex social process for producing knowledge about the natural world. Scientific knowledge represents the current consensus among scientists as to what is the best explanation for phenomena in the natural world. This consensus does not arise automatically, since scientists with different backgrounds from all over the world may interpret the same data differently. To build a consensus, scientists communicate their findings to other scientists and attempt to replicate one another's findings. In order to model the work of professional scientists, it is essential for fourth-grade students to engage in frequent discussions with peers about their understanding of their investigations. • An observation is what you see, feel, taste, hear, or smell. Scientists construct knowledge from observations and inferences, not observations alone. To communicate an observation accurately, one must provide a clear description of exactly what is observed and nothing more. Those conducting investigations need to understand the difference between what is seen and what inferences, conclusions, or interpretations can be drawn from the observation. • An inference is a tentative explanation based on background knowledge and available data. • A scientific prediction tells what may happen in some future situation. It is based on the application of scientific principles and factual information. • Accurate observations and evidence are necessary to draw realistic and plausible conclusions. A conclusion is a summary statement based on the results of an investigation. • Conclusions are drawn by making judgments after considering all the information you have gathered. Conclusions are based on details and facts. • Systematic investigations require standard measures (metric), consistent and reliable tools, and organized reporting of data. The way the data are displayed can make it easier to uncover important information. This can assist in making reliable scientific forecasts of future events. • Elapsed time is the amount of time that has passed between two given times. (<i>See Grade Four Mathematics Curriculum Framework, Standard 4.9, page 24.</i>) • An experiment is a fair test driven by a hypothesis. A fair test is one in which only one variable is compared. 	<p>as picture graphs, bar graphs, and basic line graphs.</p> <ul style="list-style-type: none"> • analyze the variables in a simple experiment. Identify the independent variable and the dependent variable. Decide which other variable(s) must be held constant (not allowed to change) in order for the investigation to represent a fair test. • create a plausible hypothesis, stated in terms of cause (if) and effect (then), from a set of basic observations that can be tested. Hypotheses can be stated in terms such as: "If the water temperature is increased, then the amount of sugar that can be dissolved in it will increase." • organize and analyze data from a simple experiment. Construct bar graphs and line graphs depicting the data. • judge which, if any, data in a simple set of results (generally 10 or fewer in number) appear to be contradictory or unusual. • present results of a simple experiment using graphs, pictures, statements, and numbers. • construct a physical model to clarify an explanation, demonstrate a relationship, or solve a need. <p>Skills</p> <ol style="list-style-type: none"> a. distinctions are made among observations, conclusions, inferences, and predictions. b. objects or events are classified and arranged according to characteristics or properties. c. appropriate instruments are selected and used to measure length, mass, volume, and temperature in metric units. d. appropriate instruments are selected and used to measure elapsed time. 		
--	---	--	--

- A hypothesis is a prediction about the relationship between variables. A hypothesis is an educated guess/prediction about what will happen based on what you already know and what you have already learned from your research. It must be worded so that it is “testable.”
- In order to conduct an experiment, one must recognize all of the potential variables or changes that can affect its outcome.
- An independent variable is the factor in an experiment that is altered by the experimenter. The independent variable is purposely changed or manipulated.
- A dependent variable is the factor in an experiment that changes as a result of the manipulation of the independent variable.
- The constants in an experiment are those things that are purposefully not changed and remain the same throughout the experiment.
- In science, it is important that experiments and the observations recorded are repeatable. There are two different types of data – qualitative and quantitative. Qualitative data deal with descriptions and data that can be observed, but not measured. Quantitative data are data that can be counted or measured and the results can be recorded using numbers. Quantitative data can be represented visually in graphs and charts. Quantitative data define whereas qualitative data describe. Quantitative data are more valuable in science because they allow direct comparisons between observations made by different people or at different times.

Example of Qualitative vs. Quantitative Data	
Main Street Elementary School Science Club	
Qualitative	Quantitative
<ul style="list-style-type: none"> • Friendly • Like science • Positive about school 	<ul style="list-style-type: none"> • 10 fourth-grade students and 12 fifth-grade students • 14 girls, 8 boys • 92 percent participated in the divisionwide science fair last year

- It is important for students to apply the science content they have learned to current events and applications.

- e. predictions and inferences are made, and conclusions are drawn based on data from a variety of sources.
- f. independent and dependent variables are identified.
- g. constants in an experimental situation are identified.
- h. hypotheses are developed as cause and effect relationships.
- i. data are collected, recorded, analyzed, and displayed using bar and basic line graphs.
- j. numerical data that are contradictory or unusual in experimental results are recognized.
- k. data are communicated with simple graphs, pictures, written statements, and numbers.
- l. models are constructed to clarify explanations, demonstrate relationships, and solve needs.
- m. current applications are used to reinforce science concepts.

Fourth Grade Science: First Nine Weeks

VA Standards of Learning (SOL) Essential Understandings for Instruction	Content Knowledge and Skills	MCPS Adopted Materials	Supporting Materials
<p>4.6 The student will investigate and understand how weather conditions and phenomena occur and can be predicted.</p> <p>The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> • Temperature is the measure of the amount of thermal energy in the atmosphere. • Air pressure is due to the weight of the air and is determined by several factors including the temperature of the air. • A front is the boundary between air masses of different temperature and humidity. • Cirrus, stratus, cumulus, and cumulo-nimbus clouds are associated with certain weather conditions. • Cumulus clouds are fluffy and white with flat bottoms. They usually indicate fair weather. However, when they get larger and darker on the bottom, they become cumulo-nimbus clouds. Cumulo-nimbus clouds may produce thunderstorms. • Stratus clouds are smooth, gray clouds that cover the whole sky (block out direct sunlight). Light rain and drizzle are usually associated with stratus clouds. • Cirrus clouds are feathery clouds. They are associated with fair weather. Cirrus clouds often indicate that rain or snow will fall within several hours. • Extreme atmospheric conditions create various kinds of storms such as thunderstorms, hurricanes, and tornadoes. • Different atmospheric conditions create different types of precipitation. 	<p>In order to meet this standard, it is expected that students will:</p> <ul style="list-style-type: none"> • design an investigation in which a thermometer is used to compare air temperatures over a period of time. • analyze the changes in air pressure occurring over time, using a barometer, and predict what the changes mean in terms of changing weather patterns. • illustrate and label high and low pressures on a map. • differentiate between the types of weather associated with high and low pressure air masses. Illustrate and label high and low pressure air masses and warm and cold fronts. • differentiate between cloud types (i.e., cirrus, stratus, cumulus, and cumulo-nimbus clouds) and the associated weather. • compare and contrast the formation of different types of precipitation (e.g., rain, snow, sleet, and hail). • recognize a variety of storm types, describe the weather conditions associated with each, and explain when they occur (e.g., thunderstorms, hurricanes, and tornadoes). • analyze and report information about temperature and precipitation on weather maps. • measure wind speed, using an anemometer. • measure precipitation with a rain gauge. • design an investigation in which weather data are gathered using meteorological tools and charted to make weather predictions. 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 6: Wild Weather</p>	<p>AIMS <u>ES Notebook</u> Thermometers & Scales Comparing Scales What is the Temperature? <p>VA Standards of Learning (SOL) Essential Understandings for Instruction</p>	<p>Content Knowledge and Skills</p>	<p>MCPS Adopted Materials</p>	<p>Supporting Materials</p>
<p>4.7 The student will investigate and understand the organization of the solar system. The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> • Our solar system is ancient. Early astronomers believed that Earth was the center of the universe and all other heavenly bodies orbited around Earth. We now know that our sun is the center of our solar system and eight planets, a handful of dwarf planets, 170 named moons, dust, gas, and thousands of asteroids and comets orbit around the sun. • Our solar system is made up of eight planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. • Mercury, Venus, Earth, and Mars are considered terrestrial planets. Jupiter, Saturn, Uranus, and Neptune are called gas giants. • Mercury is closest to the sun and is a small, heavily cratered planet. Mercury looks like our moon. Since Pluto’s reclassification from planet to dwarf planet, Mercury is now the smallest planet in our solar system. • Venus is second from the sun. It is similar to Earth in size and mass, and has a permanent blanket of clouds that trap so much heat that the temperatures on the surface of Venus are hot enough to melt lead. • Earth is third from the sun. Earth’s atmosphere, the liquid water found on Earth, and its distance from the sun, among many other factors, make Earth a haven for life. • Mars is fourth from the sun. The atmosphere on Mars is thin and there is a vast network of canyons and riverbeds on the red planet. Scientists hypothesize that Mars once supported a wet, warm Earth-like climate. • Jupiter is fifth from the sun. Jupiter is the largest planet in the solar system and is considered a gas 	<p>In order to meet this standard, it is expected that students will be able to:</p> <ul style="list-style-type: none"> • name the eight planets and describe whether they are a terrestrial planet or a gas giant. • sequence the eight planets in the solar system based on their position from the sun. (Mercury is the first from the sun, Venus is the second, etc.) • sequence the eight planets in the solar system based on size (Jupiter is the largest, Saturn is next, etc.) • construct a simple model of the sun and the planets in our solar system. <p>Skills</p> <ul style="list-style-type: none"> i. data are collected, recorded, analyzed, and displayed using bar and basic line graphs k. data are communicated with simple graphs, pictures, written statements, and numbers l. models are constructed to clarify explanations, demonstrate relationships, and solve needs 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 7: Earth Patterns, Cycles, and Change</p>	<p>AIMS <u>ES Notebook</u> The Earth Moon & Sun Solar Size Size Surprise Stringing Out the Spaces Physical Features of Earth and Moon Lunar Looking Our Star the Sun</p> <p><u>Enhanced Scope and Sequence Plus</u> The Planets Sequencing the Planets</p> <p>Websites <u>Radford University Planetarium</u></p> <p><u>Windows to the Universe</u></p> <p><u>Uncle Percy’s Adventures in Space</u></p>

<p>giant. Jupiter has no solid surface.</p> <ul style="list-style-type: none"> • Saturn is sixth from the sun. Early scientists thought Saturn was the only planet with rings, but we now know that all four gas giants (Jupiter, Saturn, Uranus, and Neptune) have rings. • Uranus is seventh from the sun. Uranus is a gas giant. • Neptune is eighth from the sun. Neptune appears blue through telescopes and is a gas giant. • The eight planets sorted by size from largest to smallest are: Jupiter, Saturn, Uranus, Neptune, Earth, Venus, Mars, and Mercury. • Pluto is no longer included in the list of planets in our solar system due to its small size and irregular orbit. Many astronomers questioned whether Pluto should be grouped with worlds like Earth and Jupiter. In 2006, this debate led the International Astronomical Union (IAU), the recognized authority in naming heavenly objects, to formally reclassify Pluto. On August 24, 2006, Pluto's status was officially changed from planet to dwarf planet. • A new distinct class of objects called "dwarf planets" was identified in 2006. It was agreed that "planets" and "dwarf planets" are two distinct classes of objects. The first members of the dwarf planet category are Ceres, Pluto and 2003 UB313, given the name Eris. More dwarf planets are expected to be announced by the IAU in the future. • What differentiates a dwarf planet from a planet? For the most part, they are identical, but there is one key difference: A dwarf planet has not "cleared the neighborhood" around its orbit, which means it has not become gravitationally dominant and it shares its orbital space with other bodies of a similar size. • Pluto is smaller than seven of the moons in our solar system and cannot be seen without a telescope.

Fourth Grade Science: Third Nine Weeks

<p>VA Standards of Learning (SOL) Essential Understandings for Instruction</p>	<p>Content Knowledge and Skills</p>	<p>MCPS Adopted Materials</p>	<p>Supporting Materials</p>
<p>4.8 The student will investigate and understand the relationships among Earth, the moon, and the sun.</p> <p>The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> • Earth completes one revolution around the sun every 365 ¼ days. The moon revolves around Earth about once every month. • Due to its axial tilt, Earth experiences seasons during its revolution around the sun. • The phases of the moon are caused by its position relative to Earth and the sun. The phases of the moon include the new, waxing crescent, first quarter, waxing gibbous, full, waning gibbous, last (third) quarter, and waning crescent. • The sun is an average-sized yellow star, about 110 times the diameter of Earth. The sun is approximately 4.6 billion years old. • Our moon is a small rocky satellite, having about one-quarter the diameter of Earth and one-eightieth its mass. It has extremes of temperature, virtually no atmosphere or life, and very little water. • Earth is one of eight planets that revolve around the sun and comprise the solar system. Earth, the third planet from the sun, is one of the four terrestrial inner planets. It is about 150 million kilometers from the sun. • Earth is a geologically active planet with a surface that is constantly changing. Unlike the other three inner planets (Mercury, Venus, and Mars), it has large amounts of life-supporting water and an oxygen-rich atmosphere. Earth's protective atmosphere blocks out most of the sun's damaging rays. 	<p>In order to meet this standard, it is expected that students will:</p> <ul style="list-style-type: none"> • differentiate between rotation and revolution. • describe how Earth's axial tilt causes the seasons. • model the formation of the eight moon phases, sequence the phases in order, and describe how the phases occur. • describe the major characteristics of the sun, including its approximate size, color, age, and overall composition. • create and describe a model of the Earth-moon-sun system with approximate scale distances and sizes. • compare and contrast the surface conditions of Earth, the moon, and the sun. • compare and contrast an Earth-centered to the sun-centered model of the solar system. • analyze the differences in what Aristotle, Ptolemy, Copernicus, and Galileo observed and what influenced their conclusions. • describe a contribution of the NASA Apollo missions to our understanding of the moon. <p>Skills</p> <ul style="list-style-type: none"> a. distinctions are made among observations, conclusions, inferences, and predictions. c. appropriate instruments are selected and used to measure length, mass, volume, and temperature in metric units. d. appropriate instruments are selected and used to measure elapsed time. e. predictions and inferences are made, and 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 7: Earth Patterns, Cycles, and Change</p>	<p>AIMS ES Notebook The Earth Moon & Sun Solar Size Size Surprise Stringing Out the Spaces Physical Features of Earth and Moon Lunar Looking Our Star the Sun Rotation & Revolution Dizzy Spells Seasonal Do-Si-Do Reasons for the Seasons Our Knowledge of Space; then and now Apollo Arrangements (use chart on p. 222) Sending Men to the Moon</p> <p>Enhanced Scope and Sequence Plus What's the Difference? Fourth Grade Science: Third Nine Weeks

<p>VA Standards of Learning (SOL) Essential Understandings for Instruction</p>	<p>Content Knowledge and Skills</p>	<p>MCPS Adopted Materials</p>	<p>Supporting Materials</p>
<p>4.4 The student will investigate and understand basic plant anatomy and life processes. The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> For many typical green plants, there are anatomical structures that perform certain basic functions. For example, roots anchor the plants and take water and nutrients from the soil. Plant stems provide support and allow movement of water and nutrients. Plants can be divided into two general groups: those that produce seeds and those that produce spores. Many seed-producing plants have roots, stems, leaves, and flowers. Seeds vary considerably in size. Orchids, for example, produce seeds as small as dust particles. The coconut is one of the largest seeds in the plant kingdom. In many seeds, the protective outer seed coat is resistant to physical damage and may also contain waxes and oils that help prevent water loss. The embryo within the seed begins as a single cell, the zygote. The basic organs of the plant body can be found in the embryo. In some seeds the embryonic leaves are quite large, filling most of the volume of the seed. The embryonic leaves are a major source of stored food for the embryo. Beans are an example of plants with large embryonic leaves. In many other plants the embryonic leaves are relatively small, and the embryo is nourished by a tissue called endosperm. Pollination is part of the reproductive process of flowering plants. Pollination is the process by which pollen is transferred from the stamens to the stigma. The stamen and pistil are reproductive parts of the flower. The sepals are the small leaves that form the housing of the developing flower. 	<p>In order to meet this standard, it is expected that students will:</p> <ul style="list-style-type: none"> analyze a common plant: identify the roots, stems, leaves, and flowers, and explain the function of each. create a model/diagram illustrating the parts of a flower and its reproductive processes. Explain the model/diagram using the following terminology: pollination, stamen, stigma, pistil, sepal, embryo, spore, seed. compare and contrast different ways plants are pollinated. explain that ferns and mosses reproduce with spores rather than seeds. explain the process of photosynthesis, using the following terminology: sunlight, chlorophyll, water, carbon dioxide, oxygen, and sugar. explain the role of adaptations of common plants to include dormancy, response to light, and response to moisture. <p>Skills</p> <ol style="list-style-type: none"> distinctions are made among observations, conclusions, inferences, and predictions. objects or events are classified and arranged according to characteristics or properties. 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 4: Life Processes</p>	<p>AIMS <u>LS Notebook</u> Plant Parts Getting to the Root of It Stem Study Leaves: Food Factory Sunlight Studies Photosynthesis and it's Products Photosynthesis Flower Power (mini book & puzzle) Pairing Up Pollenators Dissect a Seed Seeds Seeds, Spores, & More Spores, A Special Seed Playing a Dormant Role Dormancy Details</p> <p><u>Budding Botanist</u> Dissect A Seed Down Under Leaf Facts Herb Wood A Flower Study (only to label the plant parts)</p> <p><u>Enhanced Scope and Sequence Plus</u> Flower Parts Photosynthesis Plant Adaptations</p> <p>Science Is Light the Way</p>

<ul style="list-style-type: none"> • Some plants reproduce with spores. These include ferns and mosses. • Green plants produce their own food through the process of photosynthesis. Green plants use chlorophyll to produce food (sugar), using carbon dioxide, water, enzymes and other chemicals, and sunlight. Leaves are the primary food-producing part of these plants. • Oxygen is released during photosynthesis. • Plants adapt to changes in their environment in order to survive. Dormancy is a plant adaptation. Dormancy is a period of suspended life processes brought on by changes in the environment. 	<ul style="list-style-type: none"> c. appropriate instruments are selected and used to measure length, mass, volume, and temperature in metric units e. predictions and inferences are made, and conclusions are drawn based on data from a variety of sources; 		<p>Websites</p> <p>The Plant Escape</p> <p>Plants for Kids Directory</p> <p>The Seedy Side of Plants</p>

<p>4.5 The student will investigate and understand how plants and animals, including humans, in an ecosystem interact with one another and with the nonliving components in the ecosystem.</p> <p>The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> Organisms have structural adaptations or physical attributes that help them meet a life need. Organisms also have behavioral adaptations, or certain types of activities they perform, which help them meet a life need. All the organisms of the same species that live in the same place at the same time are a population. Populations of species that live in the same place at the same time together make up a community. The organization of communities is based on the utilization of the energy from the sun within a given ecosystem. The greatest amount of energy in a community is in the producers. Within a community, organisms are dependent on the survival of other organisms. Energy is passed from one organism to another. All the populations and the nonliving components in an environment that interact with each other form an ecosystem. The sun's energy cycles through ecosystems from producers through consumers and back into the nutrient pool through decomposers. A habitat is the place or kind of place in which an animal or plant naturally lives. An organism's habitat provides food, water, 	<p>In order to meet this standard, it is expected that students will be able to:</p> <ul style="list-style-type: none"> distinguish between structural (physical) and behavioral adaptations. investigate and infer the function of basic adaptations. understand that adaptations allow an organism to succeed in a given environment. explain how different organisms use their unique adaptations to meet their needs. describe why certain communities exist in given habitats. illustrate the food webs in a local area. compare and contrast the niches of several different organisms within the community. compare and contrast the differing ways an organism interacts with its surroundings at various stages of its life cycle. Specific examples include a frog and a butterfly. differentiate among positive and negative influences of human activity on ecosystems. <p>Skills</p> <ul style="list-style-type: none"> objects or events are classified and arranged according to characteristics or properties. predictions and inferences are made, and conclusions are drawn based on data from a variety of sources. data are collected, recorded, analyzed, and displayed using bar and basic line graphs. numerical data that are contradictory or 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 5: Living Systems</p>	<p>AIMS LS Notebook Ecosystems Communities Niche Pics Food Chain Chain Games Survival Rivalry Adaptations Bird Beaks and Fowl Feet This Is Your Life, Tadpole Pasta, Pie Graphs, & Painted Ladies (Stage Time) Impacting Ecosystems</p> <p>Critters Catch Me If you Can</p> <p>Field Detectives Pizza Parts & Web Wheels</p> <p>Overhead and Underfoot Color Me Safe Enhanced Scope and Sequence Plus The Best Beak for the Job Change is Good! <p>shelter, and space. The size of the habitat depends on the organism's needs.</p> <ul style="list-style-type: none"> • A niche is the function that an organism performs in the food web of that community. A niche also includes everything else the organism does and needs in its environment. No two types of organisms occupy exactly the same niche in a community. • The organization of a community is defined by the interrelated niches within it. • During its life cycle, an organism's role in the community — its niche — may change. For example, what an animal eats, what eats it, and other relationships will change. • Humans can have a major impact on ecosystems. 	<p>unusual in experimental results are recognized.</p> <p>k. data are communicated with simple graphs, pictures, written statements, and numbers.</p>		<p>STEM Activity: Critter Curators</p> <p>STEM for Teachers Website</p>

<p>4.9 The student will investigate and understand important Virginia natural resources. The concepts developed in this standard include the following:</p> <ul style="list-style-type: none"> • Virginia is rich in a wide variety of natural resources, including forests, arable (farmable) land, coal, sand and aggregates (rocks), wildlife and aquatic organisms, clean water and air, and beautiful scenery. • A watershed is an area over which surface water (and the materials it carries) flows to a single collection place. The Chesapeake Bay watershed covers approximately half of Virginia’s land area. The other two major watershed systems are the Gulf of Mexico and the North Carolina Sounds. • Virginia’s water resources include groundwater, lakes, reservoirs, rivers, bays, and the Atlantic Ocean. • Virginia has a great variety of plant and animal resources. • Natural and cultivated forests are a widespread resource in Virginia. • Virginia’s soil and land support a great variety of life, provide space for many economic activities, and offer a variety of recreational opportunities. 	<p>In order to meet this standard, it is expected that students will be able to:</p> <ul style="list-style-type: none"> • compare and contrast natural and human-made resources. • distinguish among rivers, lakes, and bays; describe characteristics of each; and name an example of each in Virginia. • create and interpret a model of a watershed. Evaluate the statement: “We all live downstream.” • identify watershed addresses. • recognize the importance of Virginia’s mineral resources, including coal, limestone, granite, and sand and gravel. • appraise the importance of natural and cultivated forests in Virginia. • describe a variety of soil and land uses important in Virginia. <p>Skills</p> <ul style="list-style-type: none"> e. predictions and inferences are made, and conclusions are drawn based on data from a variety of sources. i. data are collected, recorded, analyzed, and displayed using bar and basic line graphs. j. numerical data that are contradictory or unusual in experimental results are recognized. k. data are communicated with simple graphs, pictures, written statements, and numbers. m. current applications are used to reinforce science concepts. 	<p>Five Ponds Press: Exploring Science All Around Us, Level 4</p> <p>Chapter 8: Virginia’s Natural Wonders</p>	<p>AIMS ES Notebook Earth’s Resources Renewable Resources Nonrenewable Resources Inexhaustible Resources Resourceful Thinking Watershed Addresses Concentrating on Resources What’s Seen Downstream?
